

## Crown Portico for SharePoint

Crown Portico is a content surfacing and management solution that increases the value of your organization's content by making it more accessible. It allows knowledge workers to display and manipulate content from other platforms, like EMC Documentum, EMC eRoom, NTFS(disk) and Open-Text/LiveLink, within SharePoint. Additionally, user specified content can be moved onto the SharePoint server, including all folder structures, metadata and user information. Portico allows your organization to leverage all of your existing content management investments under a single SharePoint system, resulting in information that is optimized for your business goals.

### Multiple Systems Under One Platform

Many organizations have several content management systems in place at any given time with different departments and subsidiaries having their own platforms. Their documents, archived emails, images or collaborative intranets are often stored in completely separate technologies. This is a nightmare scenario for records management personnel and anyone responsible for content sharing or control. Such widely dispersed content can also make vital information very difficult to find and use, negatively impacting productivity. Integrating these disparate systems and information through SharePoint is emerging as a best practice to make valuable content quickly accessible to the right people, whether you are enforcing a retention policy or promoting inter-departmental collaboration.

### The Crown Solution

Crown Portico for SharePoint is designed to mitigate the substantial risks of maintaining multiple content management systems. Portico makes all of your organization's content accessible through the user-friendly Microsoft SharePoint Server. It accomplishes this in three main ways:

**View:** Through a fully customizable SharePoint application, Portico communicates with your other content management platforms and allows displaying and manipulation of that content within the SharePoint environment. You can adjust Portico based on exactly what you want to be displayed, where it should be posted and who should have access to it.

**Move:** Through a robust content movement utility, Portico's moving feature utilizes the viewer framework to allow individual users to move content from other systems into SharePoint. Similar to the viewing function, administrators can determine who moves what, where and when.

**Choose:** Choose when to utilize information directly from another repository and when to consolidate into SharePoint by migrating the content through Portico. Control how you leverage your environments and what platforms you work from.

### Key Results

- One platform, one interface, one organization
- Records Management activities are simplified and accelerated
- All content subjected to SharePoint Records Center
- Project teams have all necessary content at their fingertips, driving productivity
- Faster retirement of legacy and unsupported systems
- Content owners have full control of their material, without extra help from IT
